QA (Quality Assurance) :

* Quality Assurance is the process of Ensuring that the software development process follows proper standards and Methods to produce a high quality product.

Qc (Quality control)

* Quality control is The process of Testing. The final Software product to identify defects and ensures the product meets quality requirements.

* Quality control is a Reactive, product oriented approach that Aims to detect and defects.

QA Vs QC.

Features	QA	QC
Approach	QA follows a process oriented approaches to ensures proper development procedures.	QC follows a product oriented approaches to detect defects in The final product.
Focus	focusing on Improving The process development.	focusing on The Quality of The final product.
Goal	Goal is to prevent defects	Goal is Identify a defects.
Timeline	QA Activities are starts from beginning of The software development process.	QC Activities are happen after The product is developped.

Responsiblity	The Entire team are Responsible for The QA.	Testing Team is Responsible in QC.
Activities	Activities Included process review, Audits and documentation Checks.	Activities Included Testing, detect Identification, and bug Reporting.

QA Testing :

* QA Testing ensures the The Software development process follows quality standards to prevent defects and produce a reliable product.

* Done to Ensure the entire Software ecosystem is free of bugs, anomalies and errors.

* Conduct after The software has been built.

Requires collaboration Between devs, testers and bussiness Stake holders.

STLC :

* Software Testing Life cycle is a sequence of different testing phases followed during the software Testing process to ensure software Quality.
